

QUANT STRATEGY TOOLKIT — WORKFLOW CHEAT SHEET

A · Data Integrity & Foundations

- lookahead-audit • survivorship-check • point-in-time-fundamentals • data-source-reconciler
-

B · Signal & Strategy Construction

- regime-classifier • momentum-scorer • quality-gate • sentiment-overlay • macro-overlay • sector-concentration
-

C · Risk & Position Management

- regime-position-sizing • stop-loss-designer • profit-ladder • kelly-sizing • circuit-breaker
-

D · Backtesting & Validation

- backtest-harness • walk-forward-validation • execution-realism • performance-attribution • metrics-report
-

E · Research Discipline & Iteration

- experiment-design • training-log • revert-discipline • strategy-brief • anti-overfit

The loop

1. **Audit data** (A) → 2. **Build signal & risk** (B, C) → 3. **Backtest & validate** (D) → 4. **Plan the next experiment, log it, guard against overfit** (E) → repeat. Never trust a result you haven't audited (A) and stress-tested for overfit (anti-overfit).

Golden rules

- At every decision date, use only data knowable on that date.
- If you can't name the mechanism, your P(success) is lower than you think.
- A clean backtest is necessary, never sufficient — design bias survives audits.
- Sell rigor, not returns. Never trust (or publish) a number from a leaky backtest.

Disclaimer. Educational software only — not financial, investment, or trading advice. No guarantee of profitability. Backtested results do not predict future performance; a strategy that passes every check here can still lose money live. No live trades are placed and no credentials are stored. Trading carries substantial risk of loss. Consult a licensed professional before risking capital. See LICENSE.txt.
